

WOW!

**Guaranteed
for life...**

**Now that's
protection!**

Permanently end corrosion
and rust problems forever
in your tank

No rust or corrosion in your
fuel system

No harm to precious
paintwork

**100% GUARANTEED
RUST REMOVAL**

**Exotic tanks are
our specialty**

Exceeding the demand of today's top motorcycle manufacturers, is a task worthy of these super-exotic examples of art and industrial ingenuity. We fill the void where others fail at preventing and resolving fuel tank related problems of rust, corrosion and inferior linings and coatings. We are the only fuel tank restoration company to achieve a perfect 100% rust removal from the entire interior of the fuel tank. Our Electrochemical Disintegration Machines (EDM) leave the interior of the fuel tank in a galvanetic state of cleanliness and is ready to begin the vulcanizing process.

- The new liner is permanent
- No harm to external paintwork
- No cutting, sawing, drilling, or welding
- Any steel, aluminum, carbon fiber or fiberglass tank

SEEING IS BELIEVING

Visit our website at www.fueltankservices.com and check out all of our videos showing our processes. Do you have a previous liner which has **FAILED** ?

No problem.

We specialize in removing any liner or pretreatment from the inside of your fuel tank without touching or harming your precious paintwork.

AVOID THIS!

SOLVE YOUR
PROBLEMS
WITH OUR
**PERMANENT
LININGS**

**THE LEADER IN
PERMANENT FUEL TANK
LINERS**

Stage 1 of 12

The first step of the 12 step process is a primary cleaning of the fuel tank to setup the electrochemical process of removing any rust/ corrosion or a failed pretreatment liner for the series of events that follow.

Stage 5 of 12

The fifth step of the 12 step process is where all rust, corrosion and failed pretreatment liners are completely removed. At this stage, the interior fuel tank surface is sterile and clean and a galvanetic coating is applied before moving on to the other processes. The process of laminating layers with the newly formed liner material cures and bonds itself to the fuel tank permanently. The process continues to the next stage.

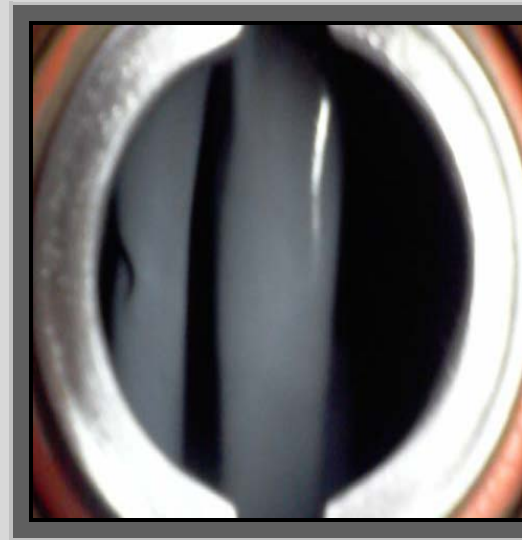

Stage 12 of 12

After careful inspection of the previous processes, the final stage of the bonding process relies on our exclusive low temperature vulcanization process. This process finalizes the bonding of our exclusive liner material and creates a permanent liner that can withstand any available fuels on the market, even hydrocarbon race fuels, including any alcohol, ethanol or methanol based fuels. Our processes are the final solution to an age-old problem that is guaranteed for life. Visit our website at www.motorcyclefueltankservices.com for details and videos of our processes.
